General Advice

**Hand washing** with soap and water for at least 15-30 seconds covering all surfaces of the hands & fingers, rinsing well & drying thoroughly is the best way to avoid spreading infection. If hands are not visibly soiled, using an alcohol-based hand rub is also effective. Be sure to cover all surfaces of hands and fingers until hands are dry. Clean hands frequently.

**Prevent the spread of the virus.** Try not to sneeze or cough near others. Use paper tissues to decrease handling nasal secretions. Avoid touching your eyes, mouth, and nose as much as possible.

Symptomatic treatment is the mainstay of treatment for upper respiratory infections. Use your medication properly. Read the labels of medication(s) and follow directions closely.

**Avoid using combination products** to treat your symptoms. Treat symptoms individually and don’t take products which contain medications for symptoms you aren’t experiencing. Combination products may cause unnecessary side effects. Antihistamines may not be helpful and have side effects such as drowsiness. The value of an antihistamine in the treatment of an upper respiratory infection remains controversial. Antihistamines are present in many cough/cold combination products.

**Avoid alcohol and recreational drugs.** These lower your body’s resistance to infection.

Rest. Resting for a day or two at 8-10 hours per day increases your ability to fight infection and prevent complications.

**Antibiotics are not helpful for a cold.** URI’s are caused by viruses. Antibiotics fight bacteria, not viruses. Unnecessary antibiotics may lead to antibiotic resistant bacteria (often needing treatment in the hospital), allergic reactions, and/or side effects (e.g. nausea, vomiting, diarrhea).
